

01/08/2005

The new JCB444 diesel engine range has been further enhanced with the introduction of the new Industrial Power Unit (IPU) variants.

The new IPU models feature engine mounted radiators, "pusher" fans, air cleaners and front/rear mounting feet.

Full engine specifications and pricing are available from Turner Powersystems upon request.

JCB444 IPU engines are available from our substantial stock at Sutton-in-Ashfield.

In 2004, JCB became the first company in the UK for 60 years to begin diesel engine manufacture using a state-of-the-art design.

The JCB444 engine has been designed to meet all the forthcoming emission and noise legislation with the minimum of design changes – a major benefit as most current engines will need significant adaptation in order to comply.

The £80 million cost of the JCB444 engine is the biggest single investment made by JCB in its 60-year history.

Turner Powersystems was awarded the UK Distributorship for the JCB444 engine range in May.
