

20/05/2005

The new JCB444 diesel engine has been exhibited by Turner Powersystems at the CIWM exhibition at Paignton in Devon.

A special cut-away version of the JCB444 engine was generating lots of interest during the duration of the exhibition from the 13th—15th June from OEM's and visitors alike.

In 2004, JCB became the first company in the UK for 60 years to begin diesel engine manufacture using a state-of-the-art design.

The JCB444 engine has been designed to meet all the forthcoming emission and noise legislation with the minimum of design changes – a major benefit as most current engines will need significant adaptation in order to comply.

The £80 million cost of the JCB444 engine is the biggest single investment made by JCB in its 60-year history.

Turner Powersystems was awarded the UK Distributorship for the JCB444 engine range in May.
